

High-Rigidity, High-Precision & High-Efficiency Design Concept

High-Rigidity

- The one-piece construction base with modular box design and optimum support maintains the machining accuracy.
- The construction base with optimum rigidity support design is proved by ultimate analysis that can guarantee maximum loading on worktable and heavyduty cutting.

High-Precision

- The spindle position is designed with symmetrical to center that provides stability of temperature level. Moreover, the short transmission system design reduces the heat conduction and extends the machine's life expectancy.
- X-axis and Y-axis is adopted THK linear roller guide ways.

High Horsepower, High Rotational Speed, High Stability

- 35-HP spindle motor, 6,000 RPM two-steps automatic change gear box.
- Output torque of 642Nm (ZF gear box), offers capability of low-speed heavy cutting and high-speed precision cutting with extensive process range. (For demand of higher torque, please contact with our sales department).

Auto Tool Change System

- The max tool diameter is 125mm & the tool length is 300mm.
- Auto tool change time is 8 sec. (Tool to Tool)

Process Ability

- Y-axis travel: 1,600mm/2,100mm/2,600mm
- Z-axis travel: 1,000mm (standard)
- Z-axis travel: 800mm (option)
- Width of Table: 1,500mm/2,000mm/2,500mm

Unique X Axis Transmission System

- Advantage of direct transmission leads that the leadscrew can rotate with no influence from belt tension.
- Direct transmission with speed-reduction mechanism is added to X-axis to increase the transmission torque, the thrust, and the capacity for workpiece weight.
- Z-axis is adopted oil pressure balance system and building in pressure saver which supports smooth and stability for acting in Z-axis.
- These three axis motors are adopted direct driven design that provides no back interstices as well as increases the machining efficiency and accuracy.

Double Column Vertical Machining Center

Ultimate Analysis Of Head Construction

Our head construction has been assayed by ultimate analysis. The strengthened head construction design can reduce deformation risk during machining.

X AXIS TRANSMISSION WAY

Direct transmission provides the following advantages for the speed reduction mechanism:

- The ball screw rotates with no influence from belt tension.
- The responses of the motor are directly sent to the ball screw.
- The backlash is minimized.
- The positioning accuracy is excellent.
- The torque and the thrust forces are increased.
- * Y-axis gantry adopts modular box-type girdle rip design with the high span linear guide ways supporting. The wide Y-axis design is suitable for big workpiece and chips collection.

Perfect Structure Design High Quality Guarantee

- Y-axis is adopted modular box girdle construction design with the high span linear guide ways supporting. Therefore, the wide Y-axis is suitable for big items cutting and chips collection.
- One-piece construction design is Agma's persist in design concept. High-stability body provides capability for higher accuracy machining. It is not only able to carry a heavy workpiece, but also to perform heavy cutting with the highest-level accuracy in industry.
- When table width is more than 2,500mm, the base is designed to be evenly supported by four roller-line rails (rail width 45mm). The design is appropriate for carrying load and increases the life of the linear guide ways, reduces deformation of table, and meets the requirement of machine accuracy.

CHARACTERISTICS OF THERMAL-DEFORMATION COMPENSATION SYSTEM

 The thermal deformation compensation system includes measurement of thermal deformation, thermal deformation math model developed based on the measured thermal deformation, and compensation card that executes the compensation process. It enhances machining accuracy, solves thermal deformation problem, and increases the cutting accuracy.

THERMAL DEFORMATION COMPENSATION MODEL IS THE ADVANTAGE FOR MOLD MAKING INDUSTRY

- Spindle & structure thermal deformation compensation
- Overcome the influence of ambient temperature.
- Suitable for long machining hours with same accuracy for mold making.
- The machine can work anytime, no need to warm up the machine in advance.

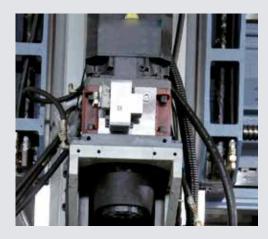

Different Types of Spindles Are Available

GEAR- DRIVEN SPINDLE

The gear-driven spindle provides spindle speed of 4,000rpm and 6,000rpm with high output torque which is the best choice for frequent heavy-cutting operations.

ZF SPINDLE

ZF spindle has higher torque than belt-driven spindle. ZF spindle provides higher rotational speed than gear driven does. ZF gear box has 1:4 speed reduction ratio mechanism. It enlarges output torque by 4 times. It offers an extra choice for users who needs high rotation speed and high torque for machining operation.

CROSS-BEAM BACK HOLDER DESIGN

The design of the back holder of cross-beams neatly aligns hydraulic unit, cooling machines, and spare parts, etc., and meets the requirement of CE regulations. This design offers two advantages:

- 1. More free spaces for operators
- 2. Easy to maintain

Spindle:6000 rpm BT50-PULLEY (α22/7000i) TORQUE (Kgf/N-m) 16.9/165.5 14.3/140.1 Cont. 26.0/34.9 22.0/29.5 18/24.8 4.2/41.4 3.6/35.0 3.1/30.0 2.6/25.2 0 1500 6000 7000 SPINDLE SPEED (rpm)

Spindle speed:6,000rpm. BT-50 taper adopts short spindle end design with use of gear box. This is suitable for heavy cutting. Spindle torque could reach 572Nm.

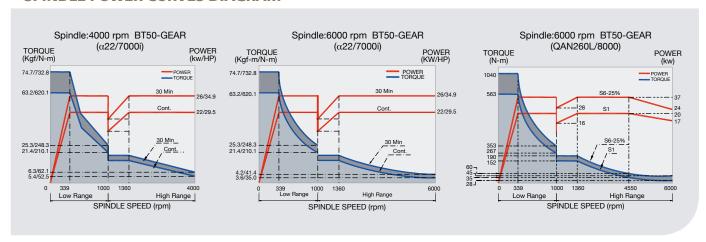

BT-50 EXTENDED LONG-END SPINDLE (opt.)

The design of the extended long-end spindle is especially suitable for deep hole machining. BT-50 inside hole taper and 6,000rpm spindle are standard design. 8,000 rpm spindle is available. It is very suitable for large mold machining.

Spindle

- The ultimate analysis illustrates the high rigidity construction design is optimum to restrain vibration and maintain stability of machining.
- The united high-precision spindle is adopted the ball bearing support design that can well endure vibration of machining.
- Spindle is adopted floating oil pressure tool clamp design.
